

At this time, based upon known vulnerabilities that exist within Apps, electronic, and technology infrastructure within the school setting, LCPS prohibits employees from downloading CGM related Apps on LCPS devices, employee personal devices, or gifted devices. Instead, the established Diabetes Medical Management Plan (DMMP) has been developed to include direction for the safe and timely monitoring for addressing the student's needs. The health clinic specialist/school nurse and/or school employees will continue to follow the developed DMMP and 504 Plan (if the student has one). The school administrator, in collaboration with the student's parent, and LCPS Student Health Services, will ensure the student has a current DMMP that has been carefully reviewed, communicated, and practiced by trained school staff.

Additionally:

- The student's DMMP and 504 Plan (if they have a 504 Plan) can be reviewed and updated should the need arise.
- The American Diabetes Association Guidelines for the Use of Continuous Glucose Monitors (CGM) and Other Sensors in the School Setting acknowledges that:
  - the possibility a CGM or sensor use and/or data sharing disruption due to device malfunction, Bluetooth glitch, or other interruptions exists; and
  - the student's DMMP should be referenced to ensure that appropriate diabetes management continues.
- LCPS cannot guarantee the device/APP would be compatible/compliant with LCPS devices/electronic infrastructure
- LCPS cannot guarantee that the App will work at all times, or will work throughout the building, or will work when it's outside.
- LCPS wants to prevent the risk of staff members becoming over-reliant on a potentially unreliable mechanism to manage a student's diabetes.
- In order for the App to be effective, it would need to be monitored constantly. In the school clinic and classroom setting, such continuous monitoring is not feasible. Therefore, LCPS school teams are encouraged to collaborate with the parent to determine a communication plan.
