Unit 9
Chemical Equations and Reactions

What is a Chemical Equation?
A Chemical Equation is a written representation of the process that occurs in a chemical reaction. A chemical equation is written with the Reactants on the left side of an arrow and the Products of the chemical reaction on the right side of the equation. The head of the arrow typically points toward the right or toward the product side of the equation, although reactions may indicate equilibrium with the reaction proceeding in both directions simultaneously.

The elements in an equation are denoted using their symbols. ___Coefficients___ next to the symbols indicate the ____stoichiometric____ numbers. Subscripts are used to indicate the number of atoms of an element present in a chemical species.

An example of a chemical equation may be seen in the combustion of methane:

\[ \text{CH}_4 + 2 \text{O}_2 \rightarrow \text{CO}_2 + 2 \text{H}_2\text{O} \]

Balancing Equations Notes

Types of Chemical Reactions Notes

- **Synthesis** - two or more elements or compounds combine to form one compound.
- **Decomposition** - a single compound decomposes into two or more elements or smaller compounds.
- **Single Replacement** - a metal will replace a less active metal in an ionic compound OR a nonmetal will replace a less active nonmetal.
- **Double Replacement** - the metals in ionic compounds switch places.
- **Combustion** - an organic compound containing carbon, hydrogen and sometimes oxygen reacts with oxygen gas to form carbon dioxide and water.

**Examples**

\[
\text{Cu(s)} + \text{AgNO}_3(aq) \rightarrow \text{Cu(NO}_3\text{)}_2(aq) + \text{Ag(s)}
\]

Single Replacement

\[
\text{C}_6\text{H}_{12}\text{O}_6(s) + \text{O}_2(g) \rightarrow \text{CO}_2(g) + \text{H}_2\text{O}(g)
\]

Combustion

\[
\text{Fe(s)} + \text{O}_2(g) \rightarrow \text{Fe}_2\text{O}_3(s)
\]

Synthesis

\[
\text{CuCl}_2(aq) + \text{Pb(NO}_3\text{)}_2(aq) \rightarrow \text{Cu(NO}_3\text{)}_2(aq) + \text{PbCl}_2(s)
\]

Double Replacement

\[
\text{CaCO}_3(s) \rightarrow \text{CaO(s)} + \text{CO}_2(g)
\]

Decomposition

**Synthesis** : Definition - two or more substances react to form 1 product. Usually releases energy, **EXOTHERMIC**. Combination reactions that contain oxygen as a reactant can also be considered combustion.

\[
A + X \rightarrow AX
\]

\[
4 \text{Fe (s)} + 3 \text{O}_2 (g) \rightarrow 2 \text{Fe}_2\text{O}_3 (s)
\]

\[
\text{CaO (s)} + \text{H}_2\text{O (l)} \rightarrow \text{Ca(OH)}_2 (s)
\]

One example of a synthesis reaction is the combination of iron and sulfur to form iron (II) sulfide:

\[
8 \text{Fe} + \text{S}_8 \rightarrow 8 \text{FeS}
\]

**DECOMPOSITION** : Definition - A single compound breaks down into 2 or more elements or compounds

\[
\text{AX} \rightarrow \text{A} + \text{X}
\]

\[
2\text{NaN}_3(s) \rightarrow 2\text{Na(s)} + 3\text{N}_2 (g)
\]

\[
2\text{KClO}_3 (s) \rightarrow 2\text{KCl (s)} + 3\text{O}_2 (g)
\]
CaCO$_3$ (s) → CaO (s) + CO$_2$ (g)

***These reactions*** often require an energy source as an initiator. Energy sources can be heat, light, or electricity. They are usually **ENDOTHERMIC**.

One example of a decomposition reaction is the electrolysis of water to make oxygen and hydrogen gas:

\[ 2\text{H}_2\text{O} \rightarrow 2\text{H}_2 + \text{O}_2 \]

- **Combustion**: Definition - Oxygen gas combines with a substance and releases energy in the form of light or heat. So combustion reactions are usually **exothermic**. Combination reactions that contain oxygen as a reactant can also be considered combustion.

\[ A + \text{O}_2 \rightarrow \text{C(s)} + \text{O}_2(g) \rightarrow \text{CO}_2(g) + \text{energy} \]
\[ 4 \text{Fe (s)} + 3\text{O}_2 \rightarrow 2\text{Fe}_2\text{O}_3 \rightarrow \text{energy} \]

*For hydrocarbons:*
\[ C_x\text{H}_y + \left[x + \left(y/4\right)\right] \text{O}_2 \rightarrow x\text{CO}_2 + \left(y/2\right)\text{H}_2\text{O} \]
\[ C_3\text{H}_8 + \text{O}_2 \rightarrow \text{CO}_2 (g) + \text{H}_2\text{O (g)} + \text{light + heat} \]

- **Single Replacement**: Definition - one ion replaces another in a compound.

\[ \text{AB} + \text{C} \rightarrow \text{AC} + \text{B} \]

One example of a single displacement reaction is when magnesium replaces hydrogen in water to make magnesium hydroxide and hydrogen gas:

\[ \text{Mg} + 2\text{H}_2\text{O} \rightarrow \text{Mg(OH)}_2 + \text{H}_2 \]

- **Double Replacement**: Definition - two ions replace each other or switch places in compounds.

\[ \text{AB} + \text{CD} \rightarrow \text{AC} + \text{BD} \]

One example of a double displacement reaction is the reaction of lead (II) nitrate with potassium iodide to form lead (II) iodide and potassium nitrate:

\[ \text{Pb(NO}_3)_2 + 2\text{KI} \rightarrow \text{PbI}_2 + 2\text{KNO}_3 \]
